Bright Coffee Shop Project Description

Project Overview & Business Problem

The Bright Coffee Shop project focuses on analysing the historical transactional data of the business to identify sales trends, evaluate product performance, and uncover opportunities for revenue growth. A newly appointed CEO aims to increase revenue and improve the performance of the business. My responsibility is to transform raw sales data into meaningful insights that support informed data-driven business decisions.

Bright Coffee Shop needs a clearer understanding of its sales performance to determine which products generate the most revenue, which time intervals experience the highest sales activity, and which products may require additional promotional support. Without a structured analysis of its transactional data, the business may miss opportunities to optimise inventory, improve marketing strategies, and increase overall revenue.

Project Objectives

- Analyse the coffee shop's sales data to identify high-performing and underperforming products
- Determine peak sales periods
- Evaluate product demand
- Develop actionable recommendations to improve business performance

Tools and Methodology

The following tools will be used:

- Figma and Canva
- Databricks SQQL
- Microsoft Excel for data analysis
- Power BI, DataStudio, Loveable and Databricks Visualisation to process, analyse, and visualise the sales data
- Canva to present the findings to the CEO

Expected Outcomes & Conclusion

The analysis aims to provide clear insights into total revenue, quantity of items sold, best-selling products, underperforming products, and peak sales periods (month, day and times). These findings will support practical recommendations, including targeted marketing campaigns during slower periods, improved stock planning for popular products, and promotional strategies for products with lower sales performance.

This project will demonstrate how data analytics, SQL, and data visualisation can be applied to a real-world business problem. By transforming raw transactional data into actionable insights, the project aims to help Bright Coffee Shop make evidence-based decisions, improve sales performance, and identify opportunities for sustainable revenue growth.
